Dear Hiring Manager,

I am writing to express my interest in Senior Java Backend Engineer opportunities focused on Java, Spring Boot, microservices, cloud platforms, event-driven architecture, and scalable backend systems. I bring more than 20 years of experience designing, developing, and modernizing enterprise platforms across finance, e-commerce, healthcare, and digital marketing.

At Sicredi, one of Brazil's largest cooperative financial institutions, I acted as the main engineer behind the evolution of an initial Personal Finance Manager proof of concept into a production-ready event-driven architecture using Scala, Akka Actors, Apache Flink, Kafka, MongoDB, and microservices. The solution enabled real-time high-volume financial data processing, safe reprocessing, and strong data integrity, later serving as a reference for other Sicredi Digital initiatives.

At Panvel, one of Brazil's largest pharmacy chains, I contributed to the full Java backend rewrite of its e-commerce platform and the migration from WebSphere to JBoss, while also leading Scrum adoption and the first mobile e-commerce version. This work combined hands-on Java delivery, modernization of legacy systems, performance and scalability improvements, and collaboration with teams working under strict business-rule requirements.

More recently, I worked with Quartile, a US-based digital marketing company, building and maintaining high-volume backend applications with C#, Python, Azure Functions, Azure Service Bus, SQL Server, and OpenAPI. I also used AI tools such as Claude and ChatGPT to support development, automation, analysis, documentation, and productivity across backend delivery.

I am based in Brazil and open to international remote contractor opportunities. I would welcome the opportunity to discuss how my background in Java backend engineering, high-volume systems, cloud integrations, technical leadership, legacy modernization, and AI-driven development workflows can contribute to your engineering team.

Best regards,

Ivã Martins
